GCSORT 1.03.02

[15 GEN 2015 Version]

User's Guide

1nd Edition, 15 Janury 2016

Sauro Menna
mennasauro@gmail.com

This work is dedicated to the memory of my niece Federica,
a strong young woman, sweet and resourceful.
You will always be in my heart and mind.

Summary of Changes

Edition	Date	Change Description
1st	15 Jan 2016	INITIAL RELEASE OF DOCUMENT
	09 Nov 2016	UPGRADE version with integration of LIBCOB New Data Types SubString search Conditional
1.0.1	15 Oct 2020	New option in command line -fsign=EBCDIC/ASCII for NUMERIC field.
1.0.1	09 Jan 2021	INREC OVERLAY – OUTREC OVERLAY
1.03.02	18 Jan 2022	RECORD CONTROL STATEMENT / DATE - Currente Date : DATE1, DATE2, DATE3, DATE4 / INREC CHANGE / OUTREC CHANGE / MODS E15 – E35

Table of Contents

1. Introduction

1.1. What is GCSort?

This document describes the features of the GCSORT utility.
GCSORT is an open-source tool for operations of sort/merge/copy files (Line Sequential, Sequential, Indexed and Relative) produced by GNUCobol compiler.
The principal developers of GCSORT are Cedric Issaly and Sauro Menna.
This document was intended to serve as a full-function reference and user's guide for GCSORT utility.

2. Features

Version 1.3.2 of GCSort contains a follow constructs:

_____

```
 gcsort help
 gcsort is a  program to sort, merge and copy records in a file into a specified order
```
_____
```
 Syntax case insensitive
 Return code : 0 (ok) - 4 (warning) - 16 (error)
```
_____
```
Usage with file parameters  : gcsort <options> take filename
Usage from command line      : gcsort <options> <control statements>
```
_____
```
gcsort options
-fsign=[ASCII|EBCDIC] define display sign representation
```
_____
```
gcsort control statements
Notations: '{name}' = parameters , '|' = Alternative format of control statement
```
_____
```
 SORT | MERGE | COPY FIELDS Control statement for Sort or Merge file(s)
 USE                 Declare input file(s)
 GIVE                Declare output file
 [ SUM FIELDS ]      Sum fields for same record key, or eliminate duplicate keys)
 [ RECORD     ]      Record control statement
 [ INCLUDE    ]      Select input records that respect include condition(s)
 [ OMIT       ]      Omit input records that respect include condition(s)
 [ INREC      ]      Reformat input record Before sort, merge or copy operation
 [ OUTREC     ]      Reformat input record After sort, merge or copy operation
 [ OUTFIL     ]      Create one or more output files for sort,merge or copy operation
 [ OPTION     ]      Specifies option for control statements
```
_____
```
gcsort
    SORT | MERGE | COPY
        FIELDS({Pos},{Len},{FormatType},{Order}, ...)         |
        FIELDS({Pos},{Len},{Order}, ...),FORMAT={FormatType}  |
        FIELDS=COPY

    USE  {Filename}
        ORG {Org}
```

```
        RECORD [F,{RecordLen}] | [V,{MinLen},{MaxLen}]
               [KEY ({Pos},{Len},{KeyType})]

    GIVE same parameters of USE

    SUM FIELDS = [({Pos},{Len},{FormatType2}, ...)]          |
                 [({Pos},{Len}, ...)],FORMAT={FormatType2}   |
                 [NONE] | [(NONE)]

_____

Environment Variables

_____

```
COB_VARSEQ_FORMAT   Used by GnuCOBOL
GCSORT_DEBUG        0 no print info, 1 info DEBUG, 2 for info Parser
GCSORT_MEMSIZE      Memory Allocation in byte (Default 512000000 byte)
GCSORT_PATHTMP      Pathname for temporary files     (Default TMP / TEMP / TMPDIR)
GCSORT_STATISTICS   0 minimal informations, 1 for Summary, 2 for Details
GCSORT_TESTCMD      0 for normal operations , 1 for ONLY test command line (NO SORT)
```

_____

3. Environment and first use

GCSort is a executable program written in 'C'.

Dependencies of executable GCSort are:

- **libcob** - GNUCobol
- **mpir / libgmp** - GNU MP

3.1. Following the steps for the first use

- Make executable gcsort
- Set environment variable to find library at runtime
- Run *gcsort <option> <command line>*
  - o <option> -fsign=[EBCDIC | ASCII]

  The *-fsign=EBCDIC* option can be used for files with ZONED fields and EBCDIC sign.

3.2. Modify first environment variables

- Set Memory Allocation (GCSORT_MEMSIZE)
- Set Statistics (GCSORT_STATISTICS) to view details of execution

3.3. Use TAKE command

- Create file text

- Insert command. Single row o one row for command.

- In the file TAKE the '*' character indicates that the rest of the line is treated as a comment

- Run : *gcsort* TAKE *filename*

Example to create TAKE file with script sh.

```
export LD_LIBRARY_PATH=/usr/local/lib
export GCSORT_MEMSIZE=1024000000
export GCSORT_BYTEORDER=0
export GCSORT_STATISTICS=2
echo "    * This is comment "                    >TAKEFILE.PRM
echo "SORT FIELDS(4,1,CH,A) "                     >TAKEFILE.PRM
echo "SUM  FIELDS=(1,2,ZD,4,2,ZD,7,4,ZD,12,4,ZD)    " >>TAKEFILE.PRM
echo "USE  ../files/SQZD03 RECORD F,396 ORG SQ     " >>TAKEFILE.PRM
echo "GIVE ../files/SQZD03.SRT  RECORD F,396 ORG SQ " >>TAKEFILE.PRM
../bin/gcsort TAKE  TAKEFILE.PRM
```

```
5. Sort

The purpose of SORT is read one or more files and create a output file with data ordered as indicated by the sort key fields.

6. Merge

The purpose of MERGE is read one or more files and create a output file with data ordered as indicated by the merge key fields.

It is mandatory that the input data is already sorted.

7. File Organization and Record Type

File organization identifies the type of file.

The types of file organization utility managed GCSORT are:

LS = Line Sequential

SQ = Sequential

IX = Indexed

RL = Relative

Record type identifies the record structure

Record type are

F = Fixed

V = Variable (first n byte record len, verify COB_VARSEQ_FORMAT in GNUCobol)

8. Field Type

Field type detects typology of field, Field type used are:

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

Date Format

Field Formats and Lengths for date.

Format	Len	Type	Date field		Format	Len	Type	Date field
Y2T	= 8	ZD	CCYYMMDD	|	Y2D	= 1	PD	YY
Y2T	= 4	ZD	YYXX	|	Y2P	= 2	PD	YY
Y2T	= 2	ZD	YYX	|	Y2U	= 3	PD	YYDDD
Y2T	= 3	ZD	YY	|	Y2S	= 2	ZD	YY
Y2T	= 5	ZD	YYDDD	|	Y2V	= 4	PD	YYMMDD
Y2T	= 6	ZD	YYMMDD	|	Y2X	= 3	PD	DDDYY
Y2B	= 1	BI	YY	|	Y2Y	= 4	PD	MMDDYY
Y2C	= 2	ZD	YY	|	Y2Z	= 2	ZD	YY

```
[ DATE - Currente Date : DATE4 ]
INCLUDE COND=(1,13,CH,GT,DATE4)
USE  ../files/inp5000.txt ORG LS RECORD F,5000
GIVE ../files/inp5000.txt.srt ORG LS  RECORD F,5000
SORT FIELDS=(35,5,ZD,A)

[ DATE + / - day - month ]
COND=(1,13,CH,GT,DATE1+5)
COND=(1,13,CH,GT,DATE1-5)
COND=(1,13,CH,GT,DATE2+3)
COND=(1,13,CH,GT,DATE2-8)
COND=(1,13,CH,GT,DATE3+150)
COND=(1,13,CH,GT,DATE3-15)

[ DATE4 ]
OMIT COND=(1,13,CH,GT,DATE4)
```

9. Commands

9.1. SORT

SORT is command for ordering data.

Format 1   **SORT**

9.2. MERGE

MERGE is command for merging data.

Format 1   **MERGE**

9.3. COPY

In SORT or MERGE command FIELDS=COPY copy data from input to output file.

Format 1   **FIELDS=COPY**

9.4. FIELDS

This command specify fields for sort/merge operations. The fields are the key for order or merging data from files.

Format 1   FIELDS (pos,len,type,order, ...) |
Format 2   FIELDS ((pos,len, order, ...),FORMAT=TYPE |
Format 3   FIELDS=COPY

FIELDS (pos, len, type, order,….)

---

pos   specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.
len   specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.
type   specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

order specifies how the field is to be ordered. The valid codes are:

    A ascending order

    D descending order

FIELDS ((pos,len,order, ...),FORMAT=type

FORMAT=type can be used to specify a particular format for one or more control fields. f from FORMAT=f is used for p,m,s fields.

FIELDS=COPY or FIELDS=(COPY)

Causes GCSORT to copy a file input to the output data sets. Records can be edited INCLUDE/OMIT, INREC, OUTREC, and OUTFIL statements; and SKIPREC and STOPAFT parameters.

9.5. USE

USE command declare input file for SORT and MERGE operation.

Format for USE:

    USE <filename > ORG <organization> RECORD [<record format>,< length>]

        [KEY ({Pos},{Len},{KeyType})

    USE <filename > ORG <organization> RECORD [<record format>, <lenght min>,< length max>]

        [KEY ({Pos},{Len},{KeyType})

filename	Input file name, with or without pathname
organization	**LS** = Line Sequential
	SQ = Sequential
	RL = Relative
	IX = Indexed

record format	F = Fixed
	V = Variable
length	Length of record
length min	Minimun length of record
length max	Maximum length of record

Structure of key (Mandatory for ORG = IX)

Pos	Position of key
Len	Length of key
KeyType	P = Primary Key
	A = Alternative Key
	D = Alternative Key with Duplicates

C = Continue definition

9.6. GIVE

GIVE command declare output file for SORT and MERGE operation.

Same rules of USE control statement.
Format for GIVE:
GIVE <filename > ORG <organization> RECORD [<record format>,< length>]
[KEY ({Pos},{Len},{KeyType})

GIVE <filename > ORG <organization> RECORD [<record format>, <lenght min>,< length max>]
[KEY ({Pos},{Len},{KeyType})

9.7. INCLUDE/OMIT

INCLUDE condition statement is used for *select* records to insert in the file output.
OMIT condition statement is used for *exclude* certain records from the file input.

INCLUDE/OMIT COND=(condition) [FORMAT=type]

condition
Format 1   (pos , len , type , cond, pos , len , type)
Format 2   (pos , len , type , cond, [X|C|Z]'[value]')
Format 3   (condition , relcond , condition)

Format 1 (pos , len , type , cond, relcond , pos , len , type)

___

pos   specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.
len   specifies the length of the field. Values for all fields must be expressed in integer numbers   of bytes.
type   specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

cond   Comparison operators are as follows:

EQ Equal to
NE Not equal to
GT Greater than
GE Greater than or equal to
LT Less than
LE Less than or equal to
SS SubString

Format 2   *(pos , len , type , cond, [X|C]'[value]')|[+/-nnnn]*

pos   specifies the first byte of a control field relative to the beginning of the input record.
The first data byte of a fixed-length record has relative position 1.
The first data byte of a variable-length record has relative position 1.

len   specifies the length of the field. Values for all fields must be expressed in integer numbers   of bytes.

type   specifies the format of the data of field.

Type	Description
CH	Char
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

cond   Comparison operators are as follows:
        EQ Equal to
        NE Not equal to
        GT Greater than
        GE Greater than or equal to
        LT Less than
        LE Less than or equal to

C'cc…c'   **Character String Format .** The value c is a ASCII character/string.

X'hh..hh'   **Hexadecimal String Format.** The value hh represents any pair of hexadecimal digits.

+/- nnnn..   **Decimal Number Format**

Format 3   *(condition , relcond , condition)*

condition   Format 1 or Format 2

relcond   Relational conditions can be logically combined, with AND or OR.
The relational condition specifies that a comparison test be performed.
Relational conditions can be logically combined, with AND or OR.

Format 4   (pos, len , CHANGE=(vlen, [X|C]'[value Find]', [X|C]'[value Set]' ….
NOMATCH=([X|C]'[value]')

CHANGE Specifies how the input field or parsed input field is to be changed to the output field, using a lookup table.

NOMATCH if an input field value does not match any of the find constants, NOMATCH values is used for output field.

Format 5   (pos, len , CHANGE=(vlen, [X|C]'[value Find]', posFind,
lenFind …. NOMATCH=(posNoMatch, lenNomatch)

CHANGE Specifies how the input field or parsed input field is to be changed to the output field, using position(*posFind*) and length(*lenFind*) of input record.

NOMATCH if an input field value does not match any of the find constants, NOMATCH input record *position* and *length* are used for output field.

9.8.INREC/OUTREC

INREC redefines the structure of record input. This operation is executed after read file input e before all operations.
The INREC control statement reformat the input records **before** they are sorted, merged, or copied.
All fields specifications presents in OUTREC, Sort Key, … must be referred to a new structure defined by INREC.

Format 1   INREC FIELDS=(FIELD-SPEC...)
Format 2   INREC BUILD=(FIELD-SPEC...)
Format 3   INREC OVERLAY=(FIELD-SPEC...)

OUTREC defines structure record output for output file.
Format 1   OUTREC FIELDS=(FIELD-SPEC...)
Format 2   OUTREC BUILD=(FIELD-SPEC...)
Format 3   OUTREC OVERLAY=(FIELD-SPEC...)

Use **OVERALY** only to overwrite existing columns or to add fields at end of every record.

Field specification is the same for INREC and OUTREC.

BUILD or FIELDS are synonymous.

FIELD-SPEC   (pos, len | posOut:pos,len | n:X | n:Z |nC'constant' | nX | nZ, |X'hh')
One or more occurrence of follow elements, separated by comma.

pos, len	**pos** = position input record, **len** = length of field
posOut:pos,len	**posOut** = position output, **pos** = position input record, **len** = length of field
n:X	Filling with Blank character (0x20) from last position to **n** (absolute position of output record).
n:Z	Filling with zero Binary (0x00) character from last position to **n** (absolute position of output record).
C'constant'	constant character value.
nC'constant'	repeat **n** times constant character value.
nX	repeat **n** times Blank character.
nZ	repeat **n** times Binary (0x00) character.
X'hh…hh'	hexdecimal string .
nX'hh…hh'	repeat **n** times hexdecimal string .

9.9. SUM FIELDS

SUM FIELDS is command for aggregate record and summarize value for numeric fields.
All fields present in SUM FIELDS are aggregate when more records has same key.

Format 1   SUM FIELDS = (pos,len,type, ...)
Format 2   SUM FIELDS = (NONE) or   SUM FIELDS = NONE

There are two formats for SUM FIELD, the first summarize numeric fields, the send NOT summarize, but eliminate duplicate key.

Format 1   *SUM FIELDS = (pos,len,type, ...)*

pos   specifies the first byte of a control field relative to the beginning of the input record.
        The first data byte of a fixed-length record has relative position 1.
        The first data byte of a variable-length record has relative position 1.
len   specifies the length of the field. Values for all fields must be expressed in integer numbers of bytes.
type   specifies the format of the data of field.

Type	Description
BI	Binary unsigned
FI	Binary signed
FL	Floating Point
PD	Packed
ZD	Zoned
CLO	Numeric sign leading
CSL	Numeric sign leading separate
CST	Numeric sign trailing separate

Format 2   *SUM FIELDS = (NONE) or   SUM FIELDS = NONE*

In this case Format2 insert into output file one occurrence of same key specified by SORT KEY.

The record output contains the first record in order of reading.

For identify a first occurrence of data, GCSORT verified the value of pointer of record into file input, selecting the lowest value.

9.10.   RECORD

RECORD control statement is option to specify the type and lengths of the records.

RECORD [TYPE=[{V}/{F}(Fixed-length)]] , [LENGTH=[{len}(L1-Input record length)]
      ','[{len}(L2-Record length)]
      ','[{len}(L3-Output record length)]

TYPE = V (Variable-length) / F (Fixed-length)
LENGTH = (L1, L2, L3)
      L1 = Input length
      L2 = Record length after E15
      L3 = Output record length

L1 is ignored if the input record length is available from USE command.
L2 is ignored if E15 is not used.
L3 is ignored if the input record length is available from GIVE command.

Example:
[RECORD CONTROL STATEMENT]

```
SORT FIELDS=(8,5,CH,A) USE  ../files/sqbig01.dat    ORG SQ GIVE ../files/sqbig01_gcs.srt  ORG SQ  RECORD TYPE=F, LENGTH=500

RECORD TYPE=F, LENGTH=(500)

RECORD TYPE=F, LENGTH=(500, ,500)

RECORD TYPE=F LENGTH=(,,500)

RECORD TYPE=F,LENGTH=(,,500)
```

9.11.   OUTFIL

OUTFIL is command to create one or more output file for a sort, copy, or merge operation.
Each file output is defined from OUTFIL command

FORMAT

OUTFIL
        FILES/FNAMES= (environment variable)
        STARTREC=nn
        ENDREC=nn
        [SAVE|[INCLUDE|OMIT] (CONDITION) [FORMAT=TYPE]]
        SPLIT
        OUTREC = (FIELD-SPEC...)

OUTFIL
        FILES/FNAMES=filename   filename = Identify a environment variable the contain the file
                                        name
        STARTREC=nn   Start write after **nn** records
        ENDREC=nn   Stop write after **nn** records

        SAVE   Save records that not used by command INCLUDE/OMIT.
        INCLUDE/OMIT (CONDITION) [FORMAT=TYPE]] Same definition for COND-FIELD (INCLUDE/OMIT)
        SPLIT   Split 1 record for each File in Group definition (FILE=file1,file,file2)
        SPLITBY=n   Split n records for each File in Group definition (FILE=file1,file,file2)
        OUTREC = (FIELD-SPEC...)   Define structure output data. Same definition for
                                        (FIELD-SPEC...).

If the environment variable filename for FILES/FNAMES is not defined, GCSort writes output file in local folder assuming the name equal at value of identifier filename (FILES/FNAMES=*filename*).

9.12.   OPTION

This command allows you to change the behavior of the utility.

Format1   **OPTION** [**SKIPREC**=nn]|[**STOPAFT**=nn]|[**VLSCMP**]|[**VLSHRT**] | [**Y2PAST**=[YY] | [YYYY]]

SKIPREC=nn	Skip nn records from input
STOPAFT=nn	Stop read after nn records
VLSCMP	0 disabled , 1 = enabled -- temporarily replace any missing compare field bytes with binary zeros
VLSHRT	0 disabled , 1 = enabled -- treat any comparison involving a short field as false
Y2PAST=YY	(YY) – Sliding = Numbers of years to subtract from the current

year.

(YYYY) – Century= Specifies the beginning of the fixed century

window.

MODS [E15 =(<name>)] [E35=(<name>)]   Routine name E15 and/or E35 Cobol Program.

Exit Routines

E15 – Routine called after file read

E15 routine is a COBOL program.
Linkage :

```
    LINKAGE       for fixed records
    01   RECORD - FLAGS           PIC 9(8) BINARY.
        88   FIRST - REC               VALUE 00.
        88   MIDDLE - REC              VALUE 04.
        88   END - REC                 VALUE 08.
    01   NEW-REC                  PIC X(nn).
    01   RETURN-REC               PIC X(nn).
    01   UNUSED1                  PIC 9(8) BINARY.
    01   UNUSED2                  PIC 9(8) BINARY.
    01   NEW-REC-LEN              PIC 9(8) BINARY
(Only for Variable Length)
    01   RETURN-REC-LEN           PIC 9(8) BINARY                (Only
for Variable Length)
    01   UNUSED5                  PIC 9(8) BINARY.
    01   EXITAREA-LEN             PIC 9(4) BINARY.
    01   EXITAREA.
      05   EAREA   OCCURS 1 TO 256 TIMES
                  DEPENDING ON EXITAREA-LEN   PIC X.
```

E35 – Routine called before write output
E35 routine is a COBOL program.

```
    LINKAGE       for fixed records
  01   RECORD-FLAGS        PIC 9(8) BINARY.
      88   FIRST-REC            VALUE 00.
```

```
        88  MIDDLE-REC            VALUE 04.
        88  END-REC               VALUE 08.
   01  LEAVING-REC.
        05 LREC OCCURS 1 TO 200 TIMES
             DEPENDING ON LEAVING-REC-LEN     PIC X.
   01  RETURN-REC.
        05 RREC OCCURS 1 TO 200 TIMES
             DEPENDING ON RETURN-REC-LEN   PIC X.
   01  OUTPUT-REC.
        05 OREC OCCURS 1 TO 200 TIMES
             DEPENDING ON OUTPUT-REC-LEN   PIC X.
   01  UNUSED1          PIC 9(8) BINARY.
   01  LEAVING-REC-LEN    PIC 9(8) BINARY.
   01  RETURN-REC-LEN     PIC 9(8) BINARY.
   01  OUTPUT-REC-LEN     PIC 9(8) BINARY.
   01  EXITAREA-LEN       PIC 9(4) BINARY.
   01  EXITAREA.
        05  EAREA    OCCURS 1 TO 256 TIMES
             DEPENDING ON EXITAREA-LEN    PIC X.
```

E15 - Return code
00 - No Action
04 - Record deleted
08 - Do Not Return
12 - Record inserted
16 - Terminate DFSORT
20 – Record Altered or Replaced

E35 – Return code
00 - No Action
04 – Record deleted
08 - Do Not Return
12 - Insert record
16 - End of GCSort

10. Environment Variables

10.1. Byte Order

GCSort can treat numeric fields in both binary format BigEndian or Native. To indicate a byte order is used environment variable GCSORT_BYTEORDER that assume 0 for Native or 1 for BigEndian. This value affects the treatment of SORT and SUM KEY FIELDS.

10.2. Temporary Files

When dimension of files input is greater of memory available, GCSort creates temporary files for sort operation. Temporary files is created in pathname specified from GCSORT_TMPFILE environment variable, if this value is not available, GCSort use TMP/TEMP environment variable or use current directory. For Windows the filename is composed from:

- Prefix   = Srt

- Name = name (created from GetTempFileName())
- Extension = .tmp
-

For Linux file name is composed from:
- Prefix = Srt
- Name = PID of process GCSort
- Num = Progressive of file
- Extension = .tmp

Temporary files are destroyed after sort operation.

10.3. Memory Allocation

The environment variable GCSORT_MEMSIZE specify amount of memory that GCSORT will use for sort operation.

GCSort analyze the value and made two area for sort operation:

(1) Key Area : this area is used for sort in memory

(2) Data Area : this area contains data record

The optimization for use of memory GCSort check dimension of key and record.

Key Area = [GCSORT_MEMSIZE] * ((Key Length + 8 + 4 + 8) / Record Length)

Data Area = [GCSORT_MEMSIZE] - Key Area

(8 + 4 + 8) 8 is pointer of record into file, 4 record length, 8 pointer to record area in memory.

If value of ((Key Length + 8 + 4 + 8)/ Record Length) is minor of 15% or major of 50%, GCSORT force this value to 15%.

10.4. Statistics

GCSort produce in output a lot of information about execution.

You can setting GCSORT_STATISTICS environment variable to three values:

0 = minimal information

Example:

```
=======================================================
GCSort Version 01.00.00
=======================================================
TAKE file name
D:\GNU_COBOL\GCSort_1_0_0\gcsort_testcase\take\par_SORT_debug.par
=======================================================

```

11. Command Line

GCSort command line accepts the following parameters:

gcsort   print version and options.

gcsort --help   print help.

gcsort --version   print version.

gcsort --config   print the value of environment variables.

gcsort *command line*   execute command line.

gcsort TAKE *filename* read filename where are present commands for Sort/Merge.

The file used in the TAKE command is free format.

12. Padding and Truncating

GCSort uses LIBCOB that defines how made record in write output operation.

13. Retun Code

GCSort has two values for return code:

   0   for success

  16   for failure

14. File Conversion

GCSort permit to specify 'ORGANIZATION' and 'RECORD TYPE' for output data different structure from input data, to permit the conversion of file format.

In this case GCSort convert data from a structure to another structure, for example, from Sequential to Line Sequential or vice versa.

If you want sort a text file (LS) and you don't know the record length, you can specify RECORD V with max len very large, example:

```
SORT KEY (1,20,CH,A)
USE F1.TXT ORG LS RECORD V,1,3000
GIVE F1.TXT.OUT ORG LS RECORD V,1,3000
```

15. Performance and Tuning

For tuning performance of GCSort is good practices modify the settings of value for memory allocation and modify dimension of area for Memory Mapped File.

GCSORT_MEMSIZE   Indicate amount of memory for sort.

GCSORT_MLT   Indicate the number of views for MMF in temporary files. This number is multiplied by Page Size of system (example 65536). Increasing this value the view for read file in memory is more greater and can reduce the elapsed time.(Temporary files).

By default GCSORT_MLT assume 63 (Example: 63 * 65536 = 4Mbyte dimension of view for MMF).

16. Limits

The max numbers of input files for Merge is 16.

The max numbers of temporary files is 16. The temporary files is reused when the size of files input is more of size of (Memory GCSORT_MEMSIZE * 16 files).

17. Errors and Warnings

GCSORT produces two types of messages:

- Error   format '*GCSort*Snnn'

- Warning   format '*GCSort*Wnnn'

For Error message GCSort break execution and terminate operation with message and return code.

For Warning message GCSort continue execution and continue operation with message.

The message string identify a specific condition of error o warning, in the of warning print a specific action.

18. GCSort by examples

18.1. SORT

SORT single file

```
=====================================================================
SORT    FIELDS(3,1,CH,A)
USE    ../PJTestCaseSort/SQBI01           RECORD F,51 ORG SQ
GIVE   ../PJTestCaseSort/SQBI01.SRT.TST  RECORD F,51 ORG SQ
=====================================================================
```

SORT single file with INCLUDE condition

Order KEY

      1) Position 37, Len 1, Character, Descending

      2) Position 18, Len 17, Character, Ascending

Filter only records with character in position 37 Equal 'C'.

```
=====================================================
SORT FIELDS=(37,1,CH,D,18,17,CH,A)
INCLUDE COND=(37,1,EQ,C'C') FORMAT=CH
USE  FIL_100.TXT              RECORD F,3000 ORG LS
GIVE FIL_100.TXT.SRT          RECORD F,3000 ORG LS
=====================================================
```

18.2. MERGE

MERGE

Merge files with KEY Position 1, Len 50, Char, Ascending

Input files sorted

Input Record Variable   from 1 to 27990 ORGanization Sequential

Output Record Variable from 1 to 27990 ORGanization Sequential

```
============================================================================
MERGE FIELDS(1,50,CH,A)
      USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
      USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
      USE   D:\GCSORTTEST\OCFILES\RGX10.DAT     RECORD V,1,27990 ORG SQ
      GIVE  D:\GCSORTTEST\OCFILES\RGX10.DAT.MRG RECORD V,1,27990 ORG SQ
============================================================================
```

MERGE

```
FIELDS=COPY
Copy records from input to output.
Include condition check binary value (low-value)
     Pos     Len     Condition     Value
from 305     04      Not Equal     Hex '00000000'

18.3.   COPY

COPY

Copy data from input to output with record filter.
Input FIXED Line Sequential, Output FIXED Line Sequential
Omitted (not insert in output file) records with condition:

       a) Position 1, Len 12, EQual , Character '000000006060'

       OR

       b) Position 1, Len 12, EQual , Character '000000000030'

       OR

       c) Position 1, Len 12, EQual , Character '000000000051'

```
